# 1. Introduction

In 2015, Transport for NSW (TfNSW), in conjunction with Acciona Ferrovia Joint Venture (AFJV), commenced the upgrade of the Pacific Highway between Warrell Creek and Nambucca Heads (WC2NH). The WC2NH project was opened to traffic in two stages:

- Stage 2a - 13.5km section from Lower Warrell Creek Bridge to Nambucca Heads opened on 18 December 2017; and
- Stage 2b - 6.25km section from the southern end of the project to the Lower Warrell Creek bridge opened on 29 June 2018.

Approvals for the WC2NH upgrade required monitoring of several species and mitigation measures during the operational phase. Species and mitigation measures targeted include koala, spotted-tailed quoll, grey-headed flying-fox, yellow-bellied glider, giant barred frog, green-thighed frog ponds, fauna underpasses, vegetated median, road-kill, exclusion fencing, and threatened flora. Sandpiper Ecological Surveys (Sandpiper) was contracted by TfNSW to deliver the WC2NH operational ecological and water quality monitoring program.

The objective of fauna underpass monitoring is “to assess use of underpasses by threatened and common fauna and to assess the effect of exclusion fencing on movement of small mammals, reptiles and frogs” (RMS 2018). Inspection of the exclusion fence occurs annually in winter and is reported in the annual report. Effectiveness of exclusion fence is also assessed in the annual road-kill report (see Sandpiper Ecological 2018, 2019)

The following interim report presents methods and results of the year two operational phase spring/summer (SS) underpass and adjacent habitat surveys. As the report is of an interim nature it includes a basic summary of results, and the discussion is limited to key points that should be considered prior to the next (winter) sampling event. Recommendations are also limited to actions that will benefit the next sampling event. A list of species names for fauna referred to in text and Tables is provided in Appendix A.

## 1.1 Background

The WC2NH upgrade features 23 fauna underpasses, including 13 box culverts, three pipe culverts and seven bridges. Underpasses targeted for monitoring were specified in the WC2NH Ecological Monitoring Program (EMP; Table 1) and include eleven box culverts and one bridge. Site five includes a dual cell box culvert with one cell designated as a wet passage (for aquatic fauna) and the other as dry passage. The dry cell includes a concrete ledge that provides dry passage for terrestrial fauna. Fauna underpasses were designed to target spotted-tailed quoll (*Dasyurus maculatus*), koala (*Phascolarctos cinereus*) and giant barred frog (*Mixophyes iteratus*). Giant barred frog is known to occur at site 1 (Upper Warrell Creek) only, whilst quoll and koala could occur at sites 2-12. Sites 9/10, and 11/12 consist of corresponding culverts on either side of a vegetated median.

**Table 1:** Underpasses sampled during operational phase monitoring of the WC2NH upgrade. SQ = spotted-tailed quoll; K = koala; GBF = giant barred frog; \* sites consists of dual cell 3x3m box culverts with one cell providing wet passage for aquatic fauna; P/A = presence/absence.

## 1.2 Study area

The WC2NH project covers a total length of 19.75km and extends from Warrell Creek in the south to Nambucca Heads in the north (Figure 1). The alignment bypasses the town of Macksville and the northern section traverses Nambucca State Forest. Eleven underpasses are situated north of the Nambucca River and one (Site 1) is situated at Upper Warrell Creek near the southern extent of the project. Sites four to twelve adjoin Nambucca State Forest and sites two and three adjoin remnant vegetation on private land.

## 2. Methods

### 2.1 Timing and weather conditions

Spring/summer underpass monitoring was conducted between 22 September 2019 and 28 February 2020. The spring/summer sample period was characterised by warm humid conditions (Table 2). Dry warm conditions occurred from September through to January with a total of 194 mm of rainfall being recorded at the Bureau of Meteorology Bellwood weather station (059150) (Appendix B, Table B1). Warm and wet conditions occurred during February with the Bellwood station receiving 427 mm (Table 2, Appendix B, Table B1). Due to limitations in access and data availability air temperature, wind and relative humidity were collected from Coffs Harbour Airport (station 059151) (Appendix B, Table B1).

**Table 2:** Summary of weather conditions recorded at Coffs Harbour Airport (station 059151) and Bellwood weather station (059150) between 22 September 2019 and 28 February 2020.

Monitoring period	Total rainfall (mm)	No. rain days	Max wind gusts (kph)	Relative Humidity (%)	Max temp range (°C)	Min temp range (°C)
Spring/Summer	665	37	22-81kph	>60% on 90% of days	18.5-35.5	6.7-25

Figure 1: Location of underpass sample sites in relation to the WC2NH alignment.

## 2.2 Underpasses

### 2.2.1 Sand pads

During the spring/summer sample period, sand pads were installed on 15 October 2019. A 50:50 mix of brickies sand and washed beach sand was used for all sand pads. Two sand pads were installed at each site. In culverts, pads were installed 3-5m from each end, whilst at the bridge (site 1) one pad was installed on each side of Warrell Creek. Each pad was approximately 50mm deep by 1m wide and extended for the entire culvert width, or for 3m at site 1. At sites with a concrete ledge the pad covered both the floor and ledge (Plate 1). The exception was site 5 where the pad covered the ledge only due to standing water over the culvert floor.

Sand pads were inspected on eight consecutive days, 16 October to 23 October at all sites during the spring/summer sampling period. Inspections were conducted by an ecologist and included a systematic scan of each pad searching for fauna tracks. A small torch was used to illuminate the pad, if required. Information recorded included species or fauna group, number of traverses, direction of traverse and pad condition (good, moderate, poor). A complete crossing was recorded when the direction and number of traverses from a species or fauna group was consistent across both pads (east and west) at each site. Incomplete crossings were recorded when the traverse direction and number of track sequences was not consistent across both sand pads. Small fauna exhibit erratic movement making it difficult to accurately determine complete and incomplete crossings. Tracks were identified with reference to Triggs (2004) and advice from senior ecologists. Tracks that could not be identified insitu were photographed and referred to a senior ecologists for identification.

**Plate 2:** Sand pad being installed in a fauna underpass on the WC2NH upgrade.

## 2.2.2 Scat and track searches

Each underpass was searched by a senior ecologist and/or ecologist for scats and tracks on two occasions during the spring/summer sample period. The search involved a slow systematic traverse of each culvert using a hand-held spotlight (Led Lenser P14). Fauna furniture, the culvert floor, and joints were targeted. Areas of accumulated fine sediment were targeted for tracks. Tracks and scats were identified in-situ, with reference to Triggs (2004) and the ecologists experience, or photographed and sent to colleagues for identification.

## 2.2.3 Cameras

Two motion-activated infra-red cameras (Swift 3C or Swift Enduro) were installed centrally in each culvert, with the exception of site five where one camera was mounted centrally in each cell. At site 1, Reconyx HC500 cameras were initially attached to steel posts, and following theft, were housed in security boxes attached to large boulders. A single camera was installed at approximately 200mm above ground near the waters edge on each side of Upper Warrell Creek (site 1). In total, 24 cameras were installed. In underpasses, both cameras were installed centrally, one on the fauna furniture, and one approximately 300mm above the culvert floor. Cameras were oriented to the east except for site 1 which were oriented perpendicular to the creek on the north and south banks. Cameras at site 9 were re-oriented to the west following a high incidence of false triggers cause by traffic on the southbound carriageway. Swift cameras were set to take 10 seconds of video with no delay between activation. Reconyx cameras were set on time-lapse mode to take a picture at 1-minute intervals between 8 pm and 6 am each day throughout the spring/summer sample period. Time-lapse mode is better suited to targeting frogs and was used

successfully to monitor frog pipes on the Sapphire to Woolgoolga Pacific Highway Upgrade (Sandpiper Ecological 2017a, 2018a). Cameras at site 1 were inundated by floodwater on several occasions in February 2020.

During the spring/summer sample period, cameras at sites 2-12 were installed on 8 October, with cameras at site 1 installed on 9 October. Cameras at sites 1-12 were checked on 22 October and 18 November to download images and replace batteries if capacity was below 50%. Between 22 October and 18 November, all cameras at sites 1, 2, 3 and 6 (8 cameras) were stolen. Replacement cameras were reinstalled on 28 November at sites 2, 3, 6 and 22 January at site 1. Cameras from sites 2-12 were retrieved on 18 December 2019 following a total sample period of 70-71 days. Cameras at site 1 were retrieved on 28 February following a sample period of 49 days.

The total number of sample days in spring/summer was 1310 across all sites (Table 3). During which nine of the 24 cameras were active for less than the 60-day minimum sample period, with eight a result of theft and one (site 11 furniture) due to battery failure. Sampling days were further reduced at site 6 (14 days) and site 1 south (14 days) due to camera malfunction and flooding. The remaining 15 cameras were active for 70-71 days.

**Table 3:** Camera survey effort during year one operational phase monitoring.

Location	Cam location	Days active (Yr 2)		
		Spr/Sum	Winter	Total

## **Image review**

Images were uploaded to a computer and viewed using Windows Photo Viewer ©. A senior ecologist or ecologist reviewed all images, with reference to standard field guides (i.e. Menkhorst & Knight 2004; Pizzey & Knight 2007; Van Dyck *et al.* undated). Input from multiple ecologists was sought to identify some images.

Fauna were scored making a complete or incomplete crossing. A complete crossing was scored when an animal showed directional movement when detected by the centrally mounted camera. An incomplete crossing was scored when an animal showed no directional movement (i.e. remained stationary in front of camera) or passed the camera but returned within 10 minutes. Crossing definitions are consistent with those used at other Pacific Highway monitoring sites (e.g. Sandpiper Ecological 2017b, 2018b, 2019) and crossing structure research programs (e.g. Soanes *et al.* 2015). Further, it represents a conservative approach to identification of complete crossings.

Data recorded for each active image included: site, date, time, species, accuracy (definite 90%+ certainty, probable 75-90% certainty, and possible 60-75% certainty), movement direction (east, west, no directional movement (animal stationary, returned), number of images and image numbers. A hierarchical approach was adopted to species identification that included: species, genus or group. If a species could not be identified or assigned to a group, it was labelled as “unidentified species”. Microbats were recorded as presence only due to their transient nature and none reliance on underpasses for thoroughfare.

## **2.3 Adjacent habitat**

### **2.3.1 Survey design**

A total of 18 sites were sampled at the 12 underpasses as part of adjacent habitat surveys. Sample sites were established on each side of an underpass or underpass pair in the case of sites 5/6, 9/10 and 11/12. Adjacent habitat at sites 5 and 6 was sampled as one site as the underpass entrances were located within 50m of each other. Survey effort was reduced at site 3 due to concern about disturbing neighbours. No spotlighting or arboreal Elliott trapping occurred on the west side at site 3 and the diurnal active search was restricted to a small (100m x 30m) triangular shaped remnant of vegetation in the road reserve.

### **2.3.2 Trapping**

Trapping methods applied during the survey included: cage traps, ground Elliott traps (Type A), arboreal Elliott traps (Type B), pitfall traps, and hair funnels. Trapping occurred within a 1ha area immediately adjacent to each culvert entrance and was conducted over three nights at each site. A maximum of 10 sites were sampled concurrently and trapping was conducted between 14 and 20 November 2019 during the spring/summer sample.

Traps were set in a “X” formation with five ground and five arboreal traps set at 20m intervals on one axis and two cage traps and two hair funnels set at 50m spacing on the other axis (Plate 2). A line of three pitfall traps with drift fence was set at the intersection of both lines (Plate 2). Pitfall traps typically followed the contour and were set near fallen logs and dense ground cover. Trap effort is summarised in Table 4.

**Plate 3:** Example of a pitfall trap line installed during adjacent habitat surveys (L). Setting up traps in adjacent habitat at site 1 (R).

Arboreal traps and ground Elliott traps were baited with a peanut butter, honey and oats mixture. Arboreal traps were installed 1.8m above ground and attached to a bracket. Honey water was sprayed on the trunk above each arboreal trap, and bait was replaced as required. A plastic bag was placed over the end of each trap to provide cover, and a small amount of leaf litter was placed inside the trap. In spring/summer, arboreal traps were set on the western side of trees to provide shelter from the morning sun. Cage traps were set in a sheltered location and alternately baited with either peanut butter, honey and oats, or sardines. A tuna oil and water mix was sprayed around the entrance to cage traps baited with sardines. All traps were checked within four hours of sunrise. In spring/summer cage and Elliott traps were closed following the morning inspection and re-opened in the late afternoon. Pitfall traps were checked in the morning and again in mid-afternoon.

Captured fauna were identified to species or genus, and, where possible, sexed and aged. Fauna were identified with reference to standard field guides (Van Dyck *et al.* 2013; Menkhorst & Knight 2004; Wilson & Swan 2010). Fauna were not marked as the aim of sampling was to determine the range of species present in adjacent habitat.

### 2.3.3 Diurnal active search

Diurnal active searches were conducted by one or two ecologists and involved a meandering traverse of habitat within 100m of the underpass entrance at each sample site. Surveys involved searching leaf litter, rolling logs, observing reptile habitat (i.e. log piles, rocks, dense leaf litter) and looking for fauna signs such as scats and tracks. Each site was sampled twice during each sample period for a minimum of 30 person minutes/sample. Spring/summer diurnal active searches were conducted between 22 September and 21 October 2019. A total of 1080 person minutes were spent conducting diurnal active searches (Table 4).

### 2.3.4 Nocturnal active search

Nocturnal surveys were conducted on each side of each underpass on two non-consecutive nights during the spring/summer sample period. One or two ecologists conducted spotlight surveys for 60 person minutes per underpass side/sample period (Table 4). Surveys were conducted using hand-held Led Lenser

P14 spotlights and involved a meandering traverse of habitat within 200m of the culvert entrance. Fauna were detected by sight and call and identified to species or genus where possible. Spring/summer surveys were conducted between 3 October and 28 November 2019. A total of 1080 person minutes was spent conducting nocturnal active searches (Table 4).

### 2.3.5 Opportunistic records

Opportunistic observations of fauna near culvert entrances made whilst doing other monitoring activities such as koala, giant barred frog and yellow-bellied glider monitoring were recorded. All fauna observed whilst setting up equipment, with exception of birds, were also recorded.

**Table 4:** Survey effort for sampling adjacent habitat on the WC2NH upgrade in spring/summer 2019.

Component	Method / culvert side	No Samples	Total effort
Arboreal Elliott traps	5 x traps @ 20m spacing	3 nights/site	510 trap nights
Ground Elliott traps	5 x Type A Elliott traps @ 20m spacing	3 nights/site	540 trap nights
Cage traps	2 @ 50m spacing	3 nights/site	216 trap nights
Pitfall traps	1 x line of 3 pits with drift fence	3 nights/site	324 trap nights
Hair funnels	2 @ 50m spacing	14 nights/site	504 trap nights
Active diurnal search	30 person minute search at UP entrance	2 sample/site	1080 person minutes
Active nocturnal search	30 person minute search at UP entrance	2 samples/site	1080 person minutes

## 3. Results

### 3.1 Underpasses

#### 3.1.1 Sand pads

Ten species and ten fauna groups were recorded during sand pad monitoring (Table 5). Species diversity was found to be highest at site 7 (8 species/groups). Rodent spp. was the most commonly recorded fauna group with tracks (incomplete and complete crossings) identified in all underpasses except sites 1 and 8 (Table 5). Koala was recorded making a complete crossing on two occasions at site 4 (Table 5, Plate 3). *Trichosurus* spp. (Brushtail possum, Plate 3) and lace monitor were reported at six sites each, while wallaby spp. (including swamp and red-necked wallabies) were recorded making complete crossings at four sites (Table 5). Of the smaller fauna groups (small mammals, reptiles and amphibians), a small lizard was reported on one occasion at site 11 and *Antechinus* spp. was reported making three complete crossings at site 2 (Table 5).

Three introduced predator species cat, dog and red fox were confirmed using the underpasses (Table 5). Cat and fox recorded the highest number of complete crossings of individual species with 28 and 21 respectively (Table 5). Crossing completions by cats was highest at site 3 where 25 complete crossings were recorded (Table 5). Fox activity was highest at site 2 where 18 complete crossings were recorded (Table 5). Dog tracks were reported on one occasion at site 6 (Table 5).

**Plate 4:** Koala tracks (L) recorded on sand pads at Site 4 and Brushtail possum tracks (R) recorded during spring/summer monitoring.

**Table 5:** Species and groups of fauna recorded making complete and incomplete crossings during sand pad monitoring at 12 underpasses on the WC2NH upgrade in spring/summer of year two monitoring. C =complete crossing, I = Incomplete crossing. \* = Threatened species.

### 3.1.2 Scat and track searches

Nine species, and ten fauna groups were recorded during scat and track surveys in spring/summer of year two (Table 6). Site 8 reported the highest diversity of fauna species and groups with eight in total (Table 6). Sites 11, 12 and 1 reported three fauna groups/species or less (Table 6). Tracks or scats of rodent spp. were found in nine of the twelve culverts and was the most commonly recorded fauna across all sites (Table 6).

Native species/fauna groups were found to be using all culverts (Table 6). The most commonly recorded was wallaby spp. at sites 1 to 8, with lace monitor and bandicoot species reported at seven sites each (Table 6). Records of small fauna visitations to the underpasses included *Antechinus* spp. at sites 11 and 12, small and medium reptiles at sites 2, 3, 5 and 8, and a green-tree frog (*Litoria* spp.) scat was recorded at site 10 (Table 6, Appendix C, Table C8). Notably, koala tracks were recorded at site 4 on 28 November and at site 9/10 on 3 October (Appendix C, Table C8).

Introduced predators were recorded at 10 of the 12 underpasses, with no records at sites 8 and 11 (Table 6). Fox and cat were both reported at six sites each and dog at two sites (Table 6).

**Table 6:** Species and fauna groups recorded during track and scat surveys of 12 underpasses on the WC2NH upgrade. I = introduced species, \* = Threatened species SS = Spring/Summer, W = Winter (data to be collected).

### 3.1.3 Cameras

#### Species richness

Twenty species, two genera and six fauna groups were recorded during underpass camera monitoring in spring/summer of year two (Table 7) The highest fauna diversity was recorded at site 5 with ten species/groups, followed by site 7 (8 species/groups), and site 2 (7 species/groups). The lowest diversity was recorded at sites 11 and 6 with two species each. Koala was the only threatened species recorded, with individuals detected at sites 4, 9, and 10 (Table 7). Five introduced species were recorded. Cat and red fox were recorded at nine sites, house mouse at one site and black rat at seven sites (Table 7).

**Table 7:** Number of complete crossings per week recorded for each species and fauna group at 12 underpasses on the WC2NH upgrade in spring/summer of year two operational phase. I = introduced species SS = Spring/Summer; W = Winter. \* = Threatened species.

**Complete and incomplete crossings**

A total of 90.2 complete crossings (cc) were recorded across all underpass structures in spring/summer of year two (Table 7). Native fauna accounted for 56.5% (50.9cc/week) of complete crossings with introduced species accounting for 43.5% (39.3cc/week) (Table 7). Native species were recorded making more complete crossings than introduced species at Sites 1, 4, 6, 7, 8, 10 and 12 (Figure 2). Whereas, introduced species were recorded making more complete crossings than native species at sites 2, 3, 5, 9, and 11 (Figure 2). Complete crossings by native species were highest at sites 8 (12.52cc/week) and 7 (11.43cc/week) (Figure 2). While the highest number of complete crossings by introduced species was recorded at sites 3 (17.9cc/week) and 5 (8.4cc/week) (Figure 2).

Short-eared brushtail possum was the most common native species with 15.6 cc/week recorded across five sites (14.7cc/week at sites 7 and 8) (Table 2). Followed by, swamp wallaby with 9.5cc/week across nine sites (Plate 5) and lace monitor 8.8 cc/week across seven sites (Table 7). Small mammals recorded making complete crossings included water rat (1.0cc/week at site 5), *Antechinus* spp. (0.6cc/week at site 7), swamp rat (0.3cc/week between sites 2 and 5), and bush rat (0.1cc/week at site 5). Koala made 0.9cc/week with 0.7cc/week at site 4 and 0.1cc/week at sites 9 and 10 (Table 7).

Of the introduced species, two feral predators, cat and red fox made up 66% (cat = 18.6/week & fox = 7.2/week) of completed crossings (Table 7). Cat was most common at site 3 where 16.1cc/week was recorded. Most of these were attributable to one easily distinguished black and white cat (Appendix C, Table C2; Plate 4). Fox was most common at site two making 5.1cc/week (Table 7). Black rat was the second-most recorded introduced species with 8.1cc/week at site 5 and 2.5cc/week at site 12 (Table 7). Dog was also recorded at site 2 with 0.4cc/week and house mouse at site 5 and 12 with a combined 0.5cc/week (Table 7).

A total of 65 incomplete crossings were recorded over the spring/summer monitoring period (see Appendix C, Table C7). Site 3 reported the highest number of incomplete crossings/week (ic/week) for native species (4.1ic/week) with the remaining sites reporting less than 0.9 ic/week (Figure 2). Incomplete crossings were not recorded at site 4 or 12 (Figure 2).

**Figure 2:** Number of complete and incomplete crossings/week by native and introduced species at each underpass during spring/summer year two operation monitoring.

**Plate 5:** Single cat responsible for the majority of complete crossings at Site 3.

**Plate 6:** Swamp wallaby recorded at site 5 during spring/summer monitoring.

**Plate 7:** Koala recorded moving east through site 9 (L) and 10 (R) on 9 September during spring/summer monitoring.

**Use of floor and fauna furniture**

Fauna were recorded using both the underpass floor and fauna furniture. In total, 72.8 cc/week were recorded on the underpass floor compared to 17.4cc/week on fauna furniture (Table 8). No fauna were recorded using fauna furniture at sites 2 and 12, and sites 1 and 5 did not contain furniture (Figure 3). Use of the underpass floor was substantially greater than use of furniture across all sites except sites 7 and 8 where the reverse occurred (Figure 3). The result at both sites (7 and 8) was due to preferential use of furniture by short-eared brushtail possum. Other species to utilise the floor and furniture were water dragon, cat, and black rat (Table 8). Koalas were recorded using the culvert floor only, and *Antechinus* spp. were recorded on furniture only (Table 8).

**Figure 3:** Complete crossings/week in spring/summer by all species on underpass floor and fauna furniture during year two operational phase monitoring. Sites 1 and 5 do not have fauna furniture installed.

**Table 8:** Number of complete crossings/week made by each species/group at each of 12 underpasses monitored on the WC2NH upgrade in spring/summer 2019. Sites 1 and 5 did not contain fauna furniture. FI = Floor, FF = fauna furniture. I = introduced species. \* = Threatened species.

### 3.2 Adjacent habitat

Thirty-two species and a further nine fauna groups were recorded in habitat adjoining underpasses (Table 9). The majority of species/groups (28 in total) were detected by diurnal and nocturnal active searches (Table 9). During trapping surveys, a total of 14 species were identified while hair funnels reported a total of seven fauna groups and species (Table 9). Several threatened species were recorded during spotlight surveys of adjacent habitat, including grey-headed flying fox on 17 occasions, koala on the eastern side of site 4 and giant barred frog at site 1 (Appendix C, Table C4).

A total of 66 individuals were captured during the spring/summer survey (Appendix C, Table C5). Sugar glider, fawn-footed melomys and black rat were captured in arboreal Elliott traps (Plates 8 & 9). Eight species, two mammals, five reptiles and one frog were captured in pitfall traps, and five species including brown antechinus, sugar glider, fawn-footed melomys, bush rat and black rat were captured in ground Elliott traps. During spring/summer trapping seven individuals were captured in cage traps (including four short-eared brushtail possum & three northern brown bandicoot), 22 in ground Elliott traps, 15 in pitfall traps and five in arboreal Elliott traps (Plate 8).

During spring/summer trapping, fawn-footed melomys was the most commonly captured species, with 22 individuals, followed by brown antechinus (10 individuals); black rat (four individuals) and bush rat (three individuals). Remaining species and groups reported two individuals or less.

**Table 9:** Species of vertebrate recorded during surveys of adjacent habitat in spring/summer 2019. SS = Spring/Summer, W = Winter. \* = Threatened species. ε = Endangered species. † denotes threatened species; ‡ = Introduced species.

### 3.3 Species recorded in underpasses and adjacent habitat

In spring/summer 2019 39 species/fauna groups were recorded in adjacent habitat and 32 in underpasses (Table 10). Excluding birds, 43% of species/groups recorded in adjacent habitat were recorded in underpasses. Red-necked wallaby, swamp rat, water rat, lace monitor, dog and green tree frog were recorded in underpasses only (Table 10). If these species are assumed to also reside in adjacent habitat the proportion of species in adjacent habitat that utilise underpasses increases to 51%. Green tree frog was the only species of amphibian reported using underpasses, while seven were reported in adjacent habitat (Table 10). Further, of the 12 reptile species/families recorded during monitoring, only two (lace monitor and eastern water dragon) were confirmed using underpasses (Table 10).

**Table 10:** Species and fauna groups recorded using underpasses by all methods and those recorded in adjacent habitat. \* denotes threatened species. E= Endangered species. I = Introduced species; SS = spring/summer; W = winter

## 4. Discussion

Interim results from year 2 spring/summer operational phase monitoring are dot pointed with reference to the indicators of success specified in the Ecological Monitoring Program (RMS 2018).

### 4.1 Low rates of use of fauna underpasses and adjacent habitats by feral predators

- Evidence of feral predators using underpasses was apparent with cat, red fox and dog recorded making complete crossings at nine of the 12 sites.
- Rates of feral predator underpass usage were not consistent throughout the study area. Higher usage rates by feral predators were recorded at sites 2 and 3. Crossings by red fox peaked at site 2 with 5.1/week, and crossings by cat peaked at site 3 with 16.1cc/week. The majority of cat crossings at site 3 were by one distinctive individual.
- Higher usage by feral predators at sites 2 and 3 is not unexpected as both sites are situated in a fragmented agricultural landscape.
- Given the high use of the underpass at site 3 by one easily distinguished cat it is likely that targeted trapping could reduce cat crossings.
- Removal of two cats from the locality in winter 2019 may have reduced cat activity around some culverts.

### 4.2 High levels of fauna underpass use by a variety of native species

- Native species regularly frequented underpasses in the study area recording 50.96cc/week across all sites. This accounted for 56.5% of all complete crossings during spring/summer monitoring.
- A total of 16 native species and a further three native fauna groups (*Antechinus* spp, *Trichosurus* spp. and *Bandicoot* spp.) were recorded making complete crossings.
- The inclusion of broad groups makes it difficult to be definitive in determining how many species from adjacent habitat have used underpasses. Most of the individuals attributed to Genera, Families and Groups would be species that were confirmed during trapping surveys. For example, *Trichosurus* spp. would be either short-eared or common brushtail possum, rodent spp. would most likely be bush rat, black rat or fawn footed melomys. Methods like sand pads only allow identification to the group level for some fauna and contribute substantially to the inclusion of broad groups such as small reptile and macropod spp.

### 4.3 No change to densities, distribution, habitat use and movement patterns compared to baseline population data of target species.

- The target species for underpass monitoring, as outlined in the project brief, are spotted-tailed quoll, koala and giant barred frog. No spotted-tailed quolls were detected during spring/summer year two, consistent with baseline monitoring (GeoLink 2014). Spotted-tailed quolls occur in low densities in northern NSW and the absence of records in underpasses is not unexpected.
- Koalas occur in low densities in Nambucca State Forest and small numbers of individuals were recorded near the alignment during baseline (1 individual), construction phase (3 individuals), and year one operational phase (3 individuals) surveys (GeoLink 2014; Geolink 2017; Sandpiper Ecological 2019b).
- Koalas were recorded using underpasses at sites 4, 9 and 10 during both sand pad and camera monitoring. However, there is no substantive baseline data to confirm if changes in habitat use and movement patterns have occurred. Results to date are encouraging as they suggest that koalas continue to maintain territory on both sides of the alignment.
- Giant barred frogs were detected in adjacent habitat at site 1 but not recorded on underpass cameras. Improved habitat connectivity beneath the Warrell Creek bridge in conjunction with significant rainfall events and reduced human disturbance may increase giant barred frog movement beneath the highway. Further monitoring is required to confirm if the species can rebound to previous population levels Sandpiper Ecological 2019c.

### 4.4 Evidence of use by dispersing individuals and different age cohorts

- Accurately confirming age of individuals using underpasses is difficult using surveys methods outlined in the EMP.
- Immature short-eared brushtail possums, following adults, were regularly recorded making complete crossings at sites 7 and 8 with two records at site 5.

### 4.5 Use by cover-dependent species with low mobility

- Several cover-dependent species (typically small mammals, reptiles and frogs) were recorded in adjacent habitat including eight frog species, three native mammals (brown antechinus, fawn-footed melomys and bush rat) and eight reptile species. Comparatively, in underpasses additional small mammal species were recorded including the cover dependent swamp rat, and the water rat. Consistent with previous surveys there were limited records of reptiles and amphibians in underpasses.
- Low occurrence of frogs and reptiles may be attributed to reduced camera detection. This issue may be overcome by installing temporary cover in underpasses such as roof/floor tiles.
- While confirmed underpass use by small mammals is encouraging, records still remain relatively sparse. Use by cover dependent species, such as antechinus is likely to improve as vegetation grows and matures at culvert entrances. At present, revegetation near underpass entrances is in poor condition owing to ongoing finishing works and drought.

### 4.7 Underpass survey effort

- Underpass survey effort was compromised due to theft of all cameras at sites 1,2,3 and 6 during the spring/summer sample.

## 5. Recommendations

1. Targeted trapping for cats should be conducted in high use underpasses during the winter 2020 survey. Sites 2 and 3 should be target sites.
2. Actively manage revegetation of underpass aprons, mulch around plants to retain moisture, replace dead plants and exclude people and machinery where possible.
3. Install two roof tiles at each of the WC2NH underpasses. Tiles would be inspected during each subsequent sample event as part of the existing contract and monitor these during the winter 2020 survey.
4. Install additional signage at culverts regarding the intent of monitoring and investigate further anti-theft measures to ensure data from camera monitoring events is not lost.

Sandpiper Ecological (2019c). Pacific Highway Upgrade – Warrell Creek to Nambucca Heads giant barred frog (*Mixophyes iteratus*) monitoring program – year 1 operational phase. Report prepared for NSW Roads and Maritime Services.

Sandpiper Ecological (2019d). Pacific Highway Upgrade –Nambucca Heads to Urunga underpass and vegetated median monitoring program monitoring – year 2 operational phase. Report prepared for NSW Roads and Maritime Services.

Soanes, K., Vesk, P. A. and van der Ree, R. (2015). Monitoring the use of road-crossing structures by arboreal marsupials: insights gained from motion-triggered cameras and passive integrated transponder (PIT) tags. *Wildlife Research*: 10.107.

Triggs, B. (2004). *Tracks, scats and other traces: a field guide to Australian mammals*. Oxford University Press, Melbourne.

Wilson, S. & Swan, G. (2010). *A complete guide to reptiles of Australia*. New Holland, Sydney.

Van Dyck, S., Gynther, I. & Baker, A. (2013). *Field companion to the mammals of Australia*. New Holland, Sydney.

# Appendix A – Species list

**Table A1:** Common and scientific names for all species recorded during year two monitoring at WC2NH. ^ = Threatened species.

Common Name	Scientific Name
Koala <sup>^</sup>	<i>Phascolarctos cinereus</i>
Swamp wallaby	<i>Wallabia bicolor</i>
Red-necked wallaby	<i>Macropus rufogriseus</i>
Wallaby spp.	
Eastern grey kangaroo	<i>Macropus giganteus</i>
	<i>Macropodidae spp.</i>
Short-beaked echidna	<i>Tachyglossus aculeatus</i>
Yellow-bellied glider <sup>^</sup>	<i>Petaurus australis</i>
Sugar glider	<i>Petaurus breviceps</i>
	<i>Petaurus spp.</i>
Feathertail glider	<i>Acrobates pygmaeus</i>
Short-eared brushtail possum	<i>Trichosurus caninus</i>
Common brushtail possum	<i>Trichosurus vulpecula</i>
Brushtail possum spp.	<i>Trichosurus spp.</i>
Common ringtail possum	<i>Pseudocheirus peregrinus</i>
Northern brown bandicoot	<i>Isodon macrourus</i>
Long-nosed bandicoot	<i>Perameles nasuta</i>
Bandicoot species	<i>Peramelidae spp.</i>
Fawn-footed melomys	<i>Melomys cervinnipes</i>
	<i>Melomys spp.</i>
Water rat	<i>Hydromys chrysogaster</i>
Bush rat	<i>Rattus fuscipes</i>
Murid spp.	<i>Muridae spp.</i>
Brown antechinus	<i>Antechinus stuartii</i>
	<i>Antechinus spp.</i>
Long-nosed potoroo <sup>^</sup>	<i>Potorous tridactylus</i>
Grey-headed flying fox <sup>^</sup>	<i>Pteropus poliocephalus</i>
Flying fox spp.	<i>Pteropus spp.</i>
Bent-wing spp.	<i>Miniopterus spp.</i>
Small mammal spp.	
	<i>Dasyuridae spp.</i>
Eastern crevice skink	<i>Egernia mcphieii</i>
Garden skink	<i>Lampropholis delicata</i>
Grass skink	<i>Lampropholis guichenoti</i>
	<i>Lampropholis spp.</i>
Red-tailed calyptotis	<i>Calyptotis ruficauda</i>
Eastern water-skink	<i>Eulamprus quoyii</i>
Three-toed skink	<i>Saiphos equalis</i>
Skink spp.	<i>Scincidae spp.</i>
Coastal carpet python	<i>Morelia spilota</i>
Red-bellied black snake	<i>Pseudechis porphyriacus</i>
Yellow-faced whipsnake	<i>Demansia psammophis</i>
Black-bellied swamp snake	<i>Hemiaspis signata</i>
Blackish blind snake	<i>Anilius nigrescens</i>
Bandy bandy	<i>Vermicella annulata</i>
Coastal carpet python	<i>Morelia spilota</i>
Burton's legless lizard	<i>Lialis burtonis</i>
Lace monitor	<i>Varanus varius</i>
Eastern water dragon	<i>Intellagama lesueurii</i>
	<i>Agamid spp.</i>
Freshwater turtle spp.	<i>Chelidae spp.</i>
Medium reptile spp.	
Small reptile spp.	
Small snake spp.	
Pacific black duck	<i>Anas superciliosa</i>
Pheasant coucal	<i>Centropus phasianinus</i>
Intermediate egret	<i>Ardea intermedia</i>
Tawny frogmouth	<i>Podargus strigoides</i>
Owlet-nightjar	<i>Aegotheles</i>

Common Name	Scientific Name
Little eagle^	<i>Hieraaetus morphnoides</i>
Eastern osprey^	<i>Pandion haliaetus</i>
Glossy Black Cockatoo^	<i>Calyptorhynchus lathami</i>
White-throated treecreeper	<i>Cormobates leucophaea</i>
Green catbird	<i>Ailuroedus crassirostris</i>
Eastern yellow robin	<i>Eopsaltria australis</i>
Eastern whipbird	<i>Psophodes olivaceus</i>
Water bird spp.	
Medium bird spp.	
Small bird spp.	
Eastern dwarf tree frog	<i>Litoria fallax</i>
Tyler's tree frog	<i>Litoria tyleri</i>
Red-eyed tree frog	<i>Litoria chloris</i>
Green tree frog	<i>Litoria cerulea</i>
Dusky toadlet	<i>Uperolia fusca</i>
	<i>Uperolia spp.</i>
Tusked frog	<i>Adelotus brevis</i>
Common eastern froglet	<i>Crinia signifera</i>
Great barred frog	<i>Mixophyes fasciolatus</i>
Giant barred frog^	<i>Mixophyes iteratus</i>
Striped marsh frog	<i>Limnodynastes peronii</i>
Red-backed toadlet	<i>Pseudophryne coriacea</i>
Medium frog spp.	
Frog spp.	
Cat	<i>Felis catus</i>
Red fox	<i>Vulpes vulpes</i>
Black rat	<i>Rattus rattus</i>
European hare	<i>Lepus europaeus</i>
House mouse	<i>Mus musculus</i>

## Appendix B – Weather and climatic conditions

**Table B1:** Weather during the spring/summer monitoring period. Rainfall taken from the BOM weather station at Bellwood (059150). Air temperature, wind and relative humidity collected from Coffs Harbour Airport (station 059151).

Date	MINIMUM Air Temperature (°C)	MAXIMUM Air Temperature (°C)	TOTAL Rain Gauge (mm)	AVERAGE Wind Direction DESCRIPTION	MAXIMUM Wind Speed (km/h)	9am Relative Humidity (%)
22/09/2019	18	26.7	0	SE		64

**Table C8:** Scat and Track search data for spring/summer of year two operational phase monitoring.

Site	Cell	Date	Check no.	Scats/tracks	Comments
1	NA	16/10/2019	1	Fox, macropod scats and tracks	
	NA	28/11/2019	2	Wallaby spp	
2	NA	16/10/2019	1	Small dasyurid, small rodent, Wallaby	
	NA	28/11/2019	2	Fox scat, wallaby scat, dasyurid scat. medium reptile, fox, cat, Bandicoot and rodent tracks.	
3	NA	16/10/2019	1	Small reptile, cat, rodent, swallow	Swallow nest present
	NA	28/11/2019	2	Tacks: cat, fox, lace monitor. Scats: swallows, cat and wallaby	
4	NA	21/10/2019	1	Microbat scat	
	NA	28/11/2019	2	Tracks: koala, rodent, lace monitor, wallaby. Scat: dasyurid, rodent	
5	S	16/10/2019	1	Med reptile tracks, rodent tracks, cat tracks, bandicoot tracks	
	N	16/10/2019	1	Rodent tracks & scats	
	S	28/11/2019	2	Tracks rodent wallaby cat fox medium reptile, scats rodent reptile	
	N	28/11/2019	2	Rodent and Bandicoot tracks	
6	NA	21/10/2019	1	Lace Monitor tracks (1/e)	
	NA	28/11/2019	2	Tracks: cat, dog, lace monitor, wallaby, rodent. Scat :dasyurid	
7	NA	04/10/2019	1	Small dasyurid, cat, fox, swamp Wallaby, Trichosurus spp., Bandicoot spp.	
	NA	28/11/2019	2	Tracks. Bandicoot, Wally, lace monitor, brushtail, dasyurid, rodent. Dasyurid scat	
8	NA	03/10/2019	1	Small macropod, bandicoot, lace Monitor, Short-beaked echidna, rodent tracks	
	NA	16/10/2019	2	Wallaby spp	
		02/11/2019	3	Lace monitor, medium reptile, wallaby. Wallaby scat	
10 & 9	E	03/10/2019	1	koala, rodent, lace Monitor tracks	
	W	03/10/2019	1	Bandicoot, koala, cat, rodent, lace Monitor tracks	
	E	28/11/2019	2	Tracks: canid, cat, lace monitor, Bandicoot, bird sp	
	W	28/11/2019	2	Tracks: dasyurid, rodent, lace monitor. Scats: green tree frog	Scat with scattered insects, between fox and dasyurid
12 & 11	E	01/10/2019	1	Nil	
	W	01/10/2019	1	Cat, bandicoot tracks, Antechinus scat	
	E	18/10/2019	2	Antechinus scat	
	W	18/10/2019	2	Nil
